Features and Benefits

Q3 & Q4 2019 (July-December)

Android:

Features	Benefits
Handheld User cannot override database without code from Desktop	Prevents Handheld user from accidently losing data
Saves information when preview button is pressed on payment screen	Handheld user no longer loses information when hitting preview button from payment screen
Gives Handheld user option to autosave information when creating invoice	Removes chance of losing data if error or problem occurs when creating invoice.
User has the ability to send Start of Day/End of Day reports to specified/chosen email	Allows user to send email to customer that is not necessarily the default email
Pictures can be captured on the signature screen at the end of an order that requires a signature	Removes need to press overflow menu on invoice screen to capture transaction image. (Simplifies process)
Allows Handheld user to see route description on route when looking at the route list during Start of Day	Gives more information when reviewing the route list and removes need to switch screens and saves time.
Ability to remove line items with zero quantity on an invoice	Reduces clutter on invoice and makes them easier to review.
Gives handheld user ability to create an order from the history of an existing one.	Removes the need to manually rekey information lessening chances of errors and saving user time.
Within android history user has the ability to restrict balance information being sent but still send the history records to the device	Gives user ability to reprint invoice for customer, without showing their current balance, which could be in need of updating
Each route has the ability to specify the number of invoice's, presales and history records	Gives user the ability to control each route independently
The handheld user can open balances to be separated from all history controls	Ensures there is no overlap between balance and history

- Gives the ability to adjust start of day load sheet after having printed the load sheet and before committing a signature

  User can change the start of day load sheet without having to get data again than reentering the entire load sheet information again. Saving Time and removing chance of user error

- Adds a print button on the load sheet in the overflow menu

  User can print a load sheet without saving and printing

- Gives ability to see the description on a short pick instead of the item number

  User can identify items without digging deeper, saving them time

- Adds a spinner menu to select available Customer Tax Codes at the creation of a new customer in Android.

  Add the correct tax code immediately, instead of during the end of day on the desktop

- Adds the ability to have the keyboard from 9 to 0 instead of 1 to 9

  Makes it easier for some drivers to fill in quantities

ECommerce:

- Grants the ability for a purchaser to save their cart for later

  So if purchaser logs out and back in their information is saved, making their shopping experience easier

- Ecommerce website will highlight the bestselling items

  Ability to better highlight customer sales on ecommerce site and most ordered items

- eCommerce uses the payment number sequence of the desktop instead of the invoice number

  Ensures that web and desktop payments use the same pool, making sure that they match

- Ecommerce sites can pay attention to excluded/exclusive flags on Customer/Zone/Channel

  Customers are unable to purchase from Desktop/Android are also unpurchaseable from Web, stopping a mismatch from occurring

- Allows overflow to have an option to remain open when the user clicks on an inventory item

  User can continue to see categories after they click on an item, helping them ensure their information is correct

Desktop:

- Gives user ability to schedule forecasting in advance

  Removes need for user don't have to remember to generate date for date that are not present.

- Adds a column in the fill by product pick screen showing the presale create date and time.

  Allows user to choose the customer that will be shorted product based on the time the order was submitted.

- Allows option to turn off the status window when importing data

  Speeds up import speed for large quantity of data

- Set a cap on how high or low the price of an item can be set

  Creates a rule to prevent user from dropping or raising prices incorrectly

- Gives the ability to select all days for a certain customer within that day

  Saves time by giving a check all option.

- Grants the ability to see and edit normal price codes on a grid.

  User no longer need to drill into each code to make mass edits of pricing. Saving them time in the implementing and reviewing of changes to price codes.

- Gives the ability to import a custom field from QuickBooks such as product type or product class

  Saves time when importing the data from QuickBooks so that data is not unnecessarily duplicated in bMobile

- Gives the ability to unpick a picked presale
  so that the user can get the order back in case a customer delays the order after it's picked

  User will not lose a presale due to the actions of a customer

- User is able to open a fixed asset and see the past customers who have ordered it, so the user can review history of the item

  Gives the user ability to delve deeper into the history of their inventory

- Gives user the ability to disable customer class posting to QuickBooks so they are able to bypass the error that comes up when trying to export customers with a customer class assigned

  Gives user more control over posting process, and removes the error that can occur within the process

- Allows handheld user to limit the amount of history the customer record calls for on load.

  Improves the performance and speed of Desktop

- Adds a taxable checkbox to be limited by the Tax Override Company Option

  Drivers will be unable to manipulate the "price" of line items by adding or removing tax

- Ability to link to truck and warehouse so when a warehouse is renamed so is the linked truck

  Removes an unnecessary step in the renaming process

- Add the company name to the right of on the vendor select

  Confirms the primary vendor is being used

- For price code maintenance the cost and wholesale column are locked from scrolling off screen

  Ability to compare columns to the price code, allowing user to check their information is correct.

- Gives the ability to take an existing EDI, and clone options set

  No longer need to manually key information back in multiple times

- Brings PO numbers on invoices from bMobile to QuickBooks Online

  Increases bMobile's ability to communicate to QuickBooks Online

- Gives option to have a unique password required to unsettle routes

  Makes sure user cannot unsettle a settled route unless they use a unique password (And removes the need for user to know the master password)

- Ability to select that a vendor alert pops up on the products & Count Fill screens

  Helps to keep orders consistent when creating multiple orders for a customer

- Grants ability to see the total wholesale cost of a presale on the pick dashboard

  User will be able to know the total wholesale cost value of the presale,
